Effective versus standard Epstein loss figure in Fe-Si sheets

Enzo Ferrara^{a,*}, Carlo Appino^a, Luciano Rocchino^a, Carlo Ragusa^b,Olivier de la Barrière^c and Fausto Fiorillo^a^aNanoscience and Materials Division, Istituto Nazionale di Ricerca Metrologica, Torino, Italy^bEnergy Department, Politecnico di Torino, Torino, Italy^cSATIE-ENS, UniverSud, Cachan, France

Abstract. The magnetic power losses have been measured at 50 Hz and different peak polarization values on different types of non-oriented and grain-oriented Fe-Si sheets using the Epstein frame, according to the current standards. The very same measurements have then been repeated by measuring polarization and tangential magnetic field by means of localized windings, centrally placed on the strips inside the Epstein frame windings, thereby retrieving the effective field and the true power loss figure. It is obtained that the ratio of the standard P_{epst} to the effective P_{eff} loss figure, which can be interpreted in terms of ratio of effective l_{eff} to conventional ($l_m = 0.94$ m) magnetic path length, evolves with the peak polarization J_p , showing, in general, a monotonic increase with increasing J_p . The deviation of P_{epst} from P_{eff} is observed to range from about -3% in the non-oriented alloys at low inductions to about +5% in the grain-oriented alloys at $J_p = 1.8$ T. This behavior finds a rationale in the existence of polarization profile $J_p(x)$ measured along the strip length and in the dependence of P_{eff} on J_p , showing a power law $P_{eff} \propto J_p^n$, with $n > 1$ and increasing with J_p . The so calculated effective path length $l_{eff} = l_m \cdot P_{epst}/P_{eff}$ consistently shows a monotonic increase with J_p , which is more relevant in the GO alloys.

Keywords: Magnetic power losses, Epstein frame, magnetic steels

1. Introduction

The 25 cm Epstein test-frame with a defined magnetic path length $l_m = 0.94$ m is a solidly assessed method for the characterization of the magnetic steel sheets. It ensures good measurement reproducibility and is widely adopted as an industry standard [1–4]. It is also well established that the specific features of the employed magnetic circuit, with the double overlapping corners and the ensuing inhomogeneous flux distribution, make the value of the measured quantities, namely the magnetic losses, different from the value of the true quantities [5,6]. True values could, however, be possibly accounted for by incorporating the complex response of the magnetic circuit into an effective magnetic path length l_{eff} , depending on the type of sheet, peak induction value, frequency, and type of excitation [7]. Should the effective (true) power loss figure P_{eff} be measured, one could express it in terms of standard power loss value P_{epst} according to

$$P_{eff} = P_{epst} \cdot l_m / l_{eff}. \quad (1)$$
